User Acceptance Test Cases:

1. Explore Page
 - a. When viewing the homepage, the user should be able to click the "Explore Page" button on the navbar. Upon clicking, it should redirect the user to a page where 6 random recipes are pulled from the database and displayed to the user. As a result, it should be the case that every time the user refreshes the explore page a different set of recipes are displayed.
2. Recipe View
 - a. At any point in exploring the site, if the user sees a recipe title it should be clickable. Upon clicking, it should redirect them to a page reserved for specifically that recipe. This page should then display the recipe title, category, ingredients, steps, and author of the recipe.
3. Profile View
 - a. At any point in exploring the site, if the user sees either their own profile name or another's profile name, it should redirect the user to a profile view page. On this page, the respective profile name should be displayed along with a table comprising all of the recipes the respective user had authored. Additionally, if a user is viewing their own profile, recipes should be colored red if they are set to private (meaning that they cannot be viewed by others). Consequently, if one user views another users profile, it should not display any red recipes.
